Project Description:

Our app was designed to allow students to easily create semester schedules for each year at ISU. Students can chat with their learning communities, can add friends and share schedules with them, and can create custom schedules or accept the default schedule created by Advisers.

Design Decisions:

- We made sure to be realistic with what we wanted to accomplish; we did not aim for any features we felt would be outside of our skill sets or would be too much to learn about by the end of the semester.
- We chose an app that would be useful to students and easy to use.
- We made our classes and database as modular as possible. We did not want redundant data.

User Interfaces

- Homepage – Student
- Homepage – Adviser
- Course List page – Student/Adviser
- Schedule Page – Student/Adviser
- Learning Community Chat Screen - Student
- Profile Screen – Student
- Edit Learning Community - Adviser

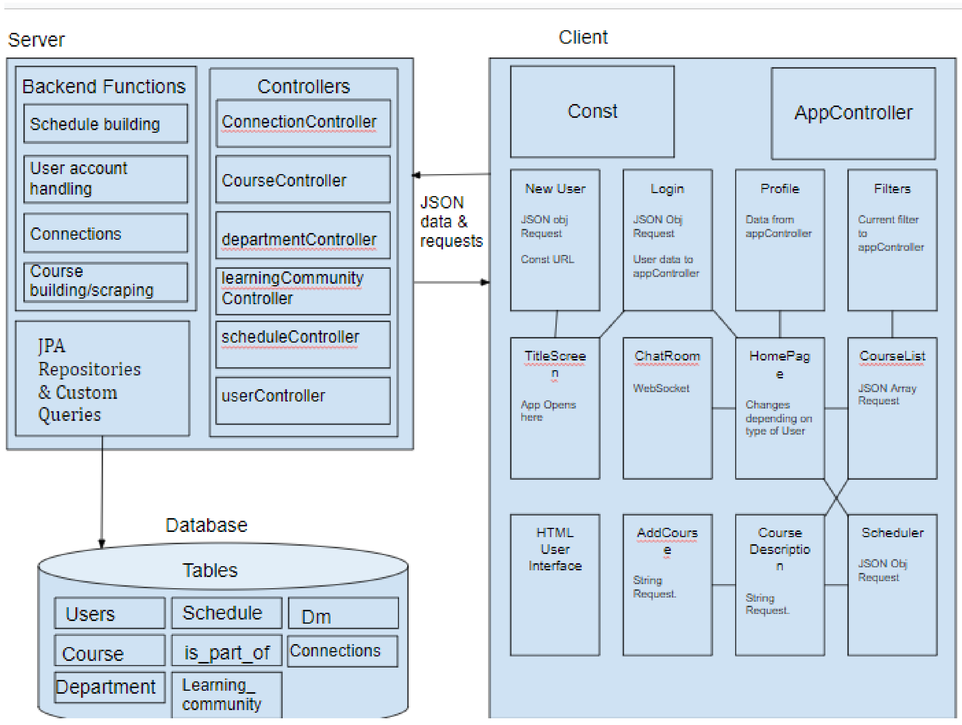
Use Cases:

- Create Schedule
- Search Courses
- Learning Community Chat
- Edit Schedule
- Send Friend Request
- Edit Profile

Users: ISU Students, Advisers, and Peer Mentors

Module Interfaces:

- **SQL –** We used an SQL database to store our data.
- **Springboot –** We used Springboot on the server side to make data handling easier.
- **Android Studio –** The client side used android studio to develop our app's user interfaces.
- **JSON –** Data was frequently transferred between the client and server side as JSON objects.



What went wrong:

- Core functionality of our app was not implemented
- Had some last-minute bugs to fix before demo 5
- The server side did not have enough features to implement by the last demo, but the features we had already implemented were too time consuming for the client side to get done by our final demo.

What went right:

- Each demo went smoothly
- Team worked well together
- Our app was fully functioning and did not crash
- Although our team was inexperienced, we were able to learn enough by each demo to make progress on our project.

Lessons Learned:

- Make sure to communicate with each other when working in different branches (server side did the same thing in different ways for the third demo)
- Learned a lot about passing data between client and server side
